From a very young age I have been around people with science/scientific backgrounds. My mother is a science teacher and has always stood by me during my studies to clear my doubts and guide me in my studies. My father is a doctor and is a specialist in Molecular Imaging. Their conversation with me since childhood revolved around science and healthcare.

I was also fortunate enough to grow up with my grandparents. A couple of years ago I lost both my grandfathers, one to Cancer and the other to Dementia. I watched both go in and out of doctor's offices along with my parents. I would also sometimes accompany them. Looking at their suffering, I was left with many questions for which I had no answers on my own. Discussing this with my parents helped me understand the problem and the limitations to treatment in each case. I sharpened my focus when I heard doctors discuss their condition. Even though, I could not understand the medical terminologies, I was explained the same in simple terms by my parents. Watching this happen in front of me generated interest in me to further understand how hospitals and doctors function. I started observing – shadowing the medical personnel during my summer vacations. During this period, I understood the need for good education along with sincerity and compassion to treat patients in the best possible way.

Once I completed my schooling, I chose Physics, Chemistry, Maths and Biology for my Pre-university course as I had decided by then, that Medicine was what I wanted to do. I completed my Pre university board (12th) from the Karnataka pre university board from Bengaluru, India in 2023.

Pursuing my studies to become a doctor has always been my long-cherished dream. I strongly feel that doctors have healing hands. I have visited the hospital multiple times with my father. When a doctor holds a patient's hand, he creates a hope for life. This has motivated me to pursue this course as my career. This is the first step towards my dream that has filled me with confidence and excitement. I am looking forward to acquiring high academic and practical skills so that I can serve humanity in the best possible way.

Further while discussing with my parents, I have understood the need for an international exposure to challenge myself to new ideas. Meeting people from various cultures with different knowledge base will in turn inculcate better ideas and approach which will serve me well in my future as a doctor.

Hungarian universities provide medical degrees that are internationally recognized by the GMC, AMA and many other organizations. Universities in Hungary offer

high quality education at affordable tuition fees. Hungary is a modern and safe country, but the cost of living is among the lowest in Europe. Hungary is a diverse, multicultural nation with lots of fun experiences for foreign students.

To fulfil my dreams of becoming a doctor I chose Hungary, as it is known for its medical excellence, reputed medical universities, well trained teachers, guides, and facilities provided in the educational institutions. I have also read and realized that these are the facilities and skills I need to embrace to achieve my dream of becoming a doctor.

The University of Pecs is one of the leading medical schools in Hungary. It has been recognized internationally for its academic achievements. It is ranked among the top 720 universities in the world by QS World University Rankings 2022. It is also a part of the European Accreditation Board, which is a testament to its academic excellence. Medium of instruction being English, I can pursue my education with a language I am comfortable with. The teaching facilities are modern and well-equipped, providing students with a high-quality education.

I aim to become a global doctor. This 6-year undergraduate program in Doctor of Medicine program will make me capable of transforming the lives of countless patients by providing them proper medication and alleviating their pain and suffering.

 I have always believed in the motto, "The service of mankind is the service of God". Studying Human medicine and understanding the complex details of the bodily systems has always fascinated me since an early age. This is the reason I look to transforming my dream of being a doctor into my profession, where, I can combine my love for Medicine and my passion of helping people and being a cause for the change in the society and mankind for good.
