STATEMENT OF PURPOSE- ABUBAKAR

This program couldn't be more perfect for me as it is covering BSc as well as Computer Engineering. I was born into a business family and my inner desire is to bring innovation in the family business especially making systems online and digitized. I am the type of person who will commit fully to a goal when my mind is clear on why I need to achieve it, just like I know why I need to accomplish a degree in computer science at this stage of my life. I am fully aware of the significance of highly educated professionals in any field of computer science as the world needs more people with specialized knowledge about computers to make technological advancements that will enrich our lives in the future, so that is why I feel the demand for such special individuals would lead to a fruitful career for me and I believe **University of Miskolc** (Hungary) will prove to be the perfect choice in making this happen for me.

I have done my intermediate with a specialization in computer science from the Lahore Board of Examination through Crescent Model Higher Secondary School, which is a well-reputed and prestigious examination board in Pakistan. I have also done my matric from the same institution as well, which is famous for its quality of education in my country and due to it being an English medium school, my English skills are quite good and I count them among my strengths. My hobbies are playing soccer, working out at the gym, playing video games, watching informative YouTube videos and watching English movies while talking about movies I want to state that my favorite movies are the Harry Potter movies: all of them!

I have learned a lot from the high-quality time I spent at my college and it is the reason I have developed skills related to time management for projects and assignments, working harmoniously with random groups of individuals about whom most of the time I knew nothing about and also owning my responsibilities as an ethical professional in my field by creating my own work without plagiarism. After completing college, I joined short courses such as web programming, software for mobile devices, computer vision and data science. I enjoyed them a lot as they developed enthusiasm and desire in me for fields such as software engineering, data science & Artificial Intelligence. I have reviewed the course modules for the program that I have applied for and I have come to the realization that.

I have worked in a full-time shipping dispatch department and realized how difficult is to manage without integrating technology. I've learned a lot from this experience in terms of professional and technical stuff. I have learned how much I love algorithms development and its real-time understanding, but after about spending two years there, I felt that the rate at which I was learning new things was gradually declining and as I love to learn things at a higher pace, I felt that making the shift to becoming a bachelor's student in the field that I love was the best move at this point in my life. I am keen on joining various clubs related or unrelated to my program as I believe they are essential in building character.

I am in my early 20s and very independent in making decisions for myself and I believe the decision to study at **University of Miskolc** (University), if made possible will prove to be a stepping stone towards a better career for me and it will be a decision the future version of me would be grateful for.
